

WHY USE CET?

CET Equine Spas – Designed from the horse out

CET Equine Spas, manufactured by CET Limited the longest established Equine Spa manufacturer in Europe, have been thoroughly tried and tested to not only deliver excellent therapy but to withstand the stresses and strains of daily usage over a long period. Some of the key aspects are listed below.

Safety

Safety features include raised side bars, front safety grille, externally sealing doors with quick release locks (easier and faster to open in the event of an emergency), no door posts to snag horses on exit and infinitely adjustable air settings. As the quietest Spas on the market, horses relax much more quickly in the CET Equine Spa. Removable rubber mats cushion the doors from kicks and help prevent injury. Quick release anti-rear straps come as standard.

Hygiene

Stainless steel will not scrape or scratch like glass fibre which could then harbour potentially injurious micro-organisms. Horse mounted manure collection harness and spa mounted options are available.

Marine Grade Stainless Steel

An immensely strong but lightweight material, marine grade stainless steel is designed specifically for corrosive conditions such as saltwater. It not only looks good but, in contrast to fibreglass, it will also withstand kicks from horses. CET do not use 304 grade stainless steel (standard in the dairy industry for example) as it is not designed for corrosive conditions and will corrode through time if used with saltwater.

Doors

All models have the option of externally sealing doors. This facilitates rapid and safe opening of the door if a horse needs to be taken out quickly and safely.

External sealing of the doors have the added benefit that there are no door posts for the horse to snag on when exiting as the internal sides of the spa are totally smooth.

Superior Filtration

After extensive research, CET selected a method of filtration which is ideal for animals. The triple filtration system not only helps to keep the water clear but protects the pump from being overloaded thereby extending its life. In addition, there is no need to constantly replace expensive filter cartridges.

Saltwater Pumps

All CET Equine Spas have premium grade pumps designed specifically for saltwater conditions to ensure a long and trouble free life.

Superior Chilling

The CET Equine Spa range is designed to chill the water in the storage tank and also it facilitates chilling of the water as it is pumped back from the spa to the storage tank after treatment. This minimises heat gain and enables the spa to be used treatment after treatment without stopping to chill the water. Titanium is utilised where the cooling system comes in contact with saltwater to ensure a long and corrosive free life.

Fully Insulated

In all models the water storage tank, the treatment unit and the pipes are insulated as standard, to minimise heat gain and keep down running costs.

After Sales Service

The quality of the components selected for CET Equine Spas is such that downtime is unusual but our policy is to maintain ongoing contact with our clients and should a problem arise the policy is to sort it with minimal fuss. For overseas clients we source key components locally to ensure that an ongoing local back up service is available.
